

Remotely monitor server issues

Before

There are servers and network systems in place, but no operators that can constantly monitor the operation status of the equipment. Therefore, there is a delay in noticing and addressing equipment issues.

After

When a server issue occurs, you can immediately notify the operator with visual, audible and/or email alerts. Even without an operator responsible for constantly monitoring the systems, this notification method ensures a quick response for any problems.

Device configuration

SERVER • NAS • UPS • PATLITE NH Series

Usage

The Network Monitoring Signal Tower uses the ping monitoring function or SNMP for servers, NAS, and UPS to notify the status of network equipment via visual, audible and/or email alerts.
